- Use only black or blue pen.

For open answers:

- Write clearly only inside the provided boxes.
- Each box should contain a single integer (positive or negative).

For multiple choice questions:

- Fill the circle of the answer you consider correct (only one answer is correct).
- Remarks and computations have no influence on points awarded.
- Any unclear or double marks will be counted as answer not given (0 points).
- Wrong answers give negative points.

## Exam instructions

- Turn off your devices and leave them in your bag.
- Only pens and Legi should be on the table.
- Fill last name and Legi number on the answer sheet.
- Turn this sheet only when instructed to do so.
- At the end of the exam, give the single answer sheet which you want to submit to an assistant, and take everything else with you.

## Questions

## NumCSE midterm, HS 2018

1. Singular Value Decomposition [4 points].

Let $A \in \mathbb{R}^{2,3}$ be defined as

$$
A=\left(\begin{array}{lll}
0 & 2 & 0 \\
3 & 0 & 0
\end{array}\right)
$$

(a) Consider the full singular value decomposition $A=U \Sigma V^{\top}$ of $A$. Determine $a, b, \alpha, \beta \in \mathbb{N}$ such that $U \in \mathbb{R}^{a, b}$ and $V \in \mathbb{R}^{\alpha, \beta} . \quad U \in \mathbb{R}^{2,2}, V \in \mathbb{R}^{3,3}$ [1 for all correct, $\mathbf{0}$ for answer not given, 0 for wrong answer]
(b) Consider the reduced singular value decomposition $A=\tilde{U} \tilde{\Sigma} \tilde{V}^{\top}$ of $A$. Determine $a, b, \alpha, \beta \in$ $\mathbb{N}$ such that $\tilde{U} \in \mathbb{R}^{a, b}$ and $\tilde{V} \in \mathbb{R}^{\alpha, \beta} . \quad \tilde{U} \in \mathbb{R}^{2,2}, \tilde{V} \in \mathbb{R}^{3,2}$ [1 for all correct,0,0]
(c) What are the non-zero singular values of $A$ ? 3,2 [ 1 for both correct, 0,0 ]
(d) Let $\tilde{A} \in \mathbb{R}^{2,3}$ be the best rank-1 approximation of $A$. Let $\|\cdot\|_{F}$ denote the Frobenius norm. What is the value of $\|A-\tilde{A}\|_{F}$ ? $\quad 2[\mathbf{1 , 0 , 0}]$
2. Complexity [4 points].

Consider the following Eigen/C++ code:

```
MatrixXd A = MatrixXd::Zero(n, n);
A(0, 0) = 1.0; A(1, 0) = 1.0;
for (int j = 1; j < n - 1; ++j) {
    for (int i = j - 1; i < j + 2; ++i) {
        A(i, j) = 1.0;
    }
}
A(n-2, n-1) = 1.0; A(n-1, n - 1) = 1.0;
MatrixXd Q = A.householderQr().householderQ();
cout << Q;
for (int i = 0; i < n*n; ++i) {
    VectorXd b = VectorXd::Random(n);
    VectorXd M = A.fullPivLu().solve(b);
    cout << M;
}
FullPivLU<MatrixXd> lu = A.fullPivLu();
for (int i = 0; i < n*n; ++i) {
    VectorXd b = VectorXd::Random(n);
    VectorXd M = lu.solve(b);
    cout << M;
}
```

complexity.cpp

You can assume that lines 22 and 29 run in $O(\mathrm{n})$. What integer $\alpha$ is such that $O\left(\mathrm{n}^{\alpha}\right)$ is the lowest correct asymptotic complexity of...
(a) ...lines 10-16? $\quad 1[\mathbf{1 , 0 , 0}]$
(b) ...lines 27-32? $4[1,0,0]$
(c) ...lines 21-25? $5[\mathbf{1 , 0 , 0}]$
(d) ...lines 18-19? $3[\mathbf{1 , 0 , 0}]$
3. Cancellation [4 points].

Which side of the equations below should be preferred in order to minimize the impact of cancellation? On the answer sheet, we abbreviate left-hand side (LHS) and right-hand side (RHS).
(a) For large $x \gg 1$ :

$$
\frac{(x+1)^{2}-x^{2}}{x}=2+\frac{1}{x}
$$

RHS [1,0,-1]
(b) For large $x \gg 1$ :

$$
\frac{1}{\sqrt{x^{2}+1}+x}=\sqrt{x^{2}+1}-x
$$

LHS [1,0,-1]
(c) For small $x>0$ :

$$
\frac{2 x^{2}}{(1+2 x)(1+x)}=\frac{1}{1+2 x}-\frac{1-x}{1+x}
$$

LHS [1,0,-1]
(d) For small $x>0$ :

$$
(1-x)^{2}-1=x^{2}-2 x
$$

RHS [1,0,-1]
4. Householder reflections [8 points].

The Householder matrix for a reflection about the hyper-plane with normal vector $\mathbf{v}$ is

$$
\mathbf{H}_{\mathbf{v}}:=\mathbf{I}_{\mathbf{m}}-2 \frac{\mathbf{v} \mathbf{v}^{T}}{\mathbf{v}^{T} \mathbf{v}}=\mathbf{I}_{\mathbf{m}}-2 \tilde{\mathbf{v}} \tilde{\mathbf{v}}^{T}
$$

where $\tilde{\mathbf{v}}=\frac{\mathbf{v}}{\|\mathbf{v}\|_{2}}$ is a unit vector and $\mathbf{I}_{\mathbf{m}}$ is an identity matrix of size $m \times m$. Note that $\mathbf{H}_{\mathbf{v}}$ is symmetric and orthogonal.

We want to reduce a matrix $\mathbf{A} \in \mathbb{R}^{3,3}$ to an upper triangular form $\mathbf{R}$ using successive Householder transformations

$$
\mathbf{H}_{\mathbf{v}^{2}} \mathbf{H}_{\mathbf{v}^{1}} \mathbf{A}=\mathbf{R},
$$

where

$$
\mathbf{A}=\left[\begin{array}{ccc}
-3 & 20 & 1 \\
4 & -20 & -1 \\
0 & 3 & 2
\end{array}\right]
$$

(a) Find the unit vector $\tilde{\mathbf{v}}^{\mathbf{1}} \in \mathbb{R}^{3}$ such that the first element of $\tilde{\mathbf{v}}^{1}$ is negative and the second element is positive.
(b) Find the unit vector $\tilde{\mathbf{v}}^{2} \in \mathbb{R}^{3}$ such that the second and third element of $\tilde{\mathbf{v}}^{2}$ are both positive.

## Solution:

$$
\tilde{\mathbf{v}}^{1}=\frac{1}{\sqrt{5}}\left[\begin{array}{c}
-2 \\
1 \\
0
\end{array}\right] \quad, \quad \tilde{\mathbf{v}}^{2}=\frac{1}{\sqrt{10}}\left[\begin{array}{l}
0 \\
3 \\
1
\end{array}\right] .
$$

## [4 for each vector fully correct, 0,0 ]

The reflecting vector can be obtained as:

$$
\begin{aligned}
\mathbf{v}^{\mathbf{1}} & =\mathbf{a}^{\mathbf{1}}+\operatorname{sign}\left(\mathbf{a}^{\mathbf{1}}{ }_{1}\right)\left\|\mathbf{a}^{\mathbf{1}}\right\|_{2}^{2} \mathbf{e}^{\mathbf{1}} \\
& =\left[\begin{array}{c}
-3 \\
4 \\
0
\end{array}\right]-5\left[\begin{array}{l}
1 \\
0 \\
0
\end{array}\right]=\left[\begin{array}{c}
-8 \\
4 \\
0
\end{array}\right] . \\
\tilde{\mathbf{v}}^{1} & =\frac{1}{\sqrt{80}}\left[\begin{array}{c}
-8 \\
4 \\
0
\end{array}\right] .
\end{aligned}
$$

The corresponding Householder matrix can be computed as:

$$
\begin{aligned}
\mathbf{H}_{\mathbf{v}^{\mathbf{1}}} & =\mathbf{I}_{3}-2 \frac{\mathbf{v}^{\mathbf{1}}\left(\mathbf{v}^{\mathbf{1}}\right)^{T}}{\left(\mathbf{v}^{\mathbf{1}}\right)^{T} \mathbf{v}^{\mathbf{1}}} \\
& =\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]-2\left[\begin{array}{ccc}
\frac{4}{5} & -\frac{2}{5} & 0 \\
-\frac{2}{5} & \frac{1}{5} & 0 \\
0 & 0 & 0
\end{array}\right] \\
& =\left[\begin{array}{ccc}
-\frac{3}{5} & \frac{4}{5} & 0 \\
\frac{4}{5} & \frac{3}{5} & 0 \\
0 & 0 & 1
\end{array}\right] .
\end{aligned}
$$

Premultiplying A by $\mathrm{H}_{\mathrm{v}^{1}}$ gives:

$$
\mathbf{H}_{\mathbf{v}^{1}} \mathbf{A}=\left[\begin{array}{ccc}
5 & -28 & -\frac{7}{5} \\
0 & 4 & \frac{1}{5} \\
0 & 3 & 2
\end{array}\right]
$$

Now we can obtain $\mathrm{v}^{2}$ as follows:

$$
\begin{aligned}
& \mathbf{v}^{2}=\left[\begin{array}{l}
0 \\
4 \\
3
\end{array}\right]+5\left[\begin{array}{l}
0 \\
1 \\
0
\end{array}\right]=\left[\begin{array}{l}
0 \\
9 \\
3
\end{array}\right] . \\
& \tilde{\mathbf{v}}^{2}=\frac{1}{\sqrt{90}}\left[\begin{array}{l}
0 \\
9 \\
3
\end{array}\right] .
\end{aligned}
$$

5. Convolution [6 points].

Let

$$
x=(4,8,12,16,14,8,8,8,8,-11,12,-12,13) .
$$

Let $*$ indicate the discrete linear convolution and $*_{p}$ the discrete periodic convolution with period $p$. Let $z[i]$ indicate the element at position $i$ of any vector $z$. For instance: $x[0]=4$ and $x[12]=13$.
(a) If $y=(3,-3,3)$ what is $\left(y *_{3} y\right)[0]$ ? $\quad \mathbf{- 9}[\mathbf{1 , 0 , 0}]$
(b) If $y=(1,2,3,4)$, what is the length of $x * y ? \quad \mathbf{1 6}[\mathbf{1}, \mathbf{0}, \mathbf{0}]$
(c) If $y=(1,-1,1,-1,1)$, what is $(x * y)[3]$ ? $\quad \mathbf{8}[\mathbf{1 , 0 , 0}]$
(d) If $y=(7,7,-7,-7,7,7,-7,-7)$ what is $(x * y)[11]$ ? $\quad \mathbf{- 2 1}[\mathbf{1}, \mathbf{0}, \mathbf{0}]$
(e) If $y=(2,-1)$, what is $\left(x *_{16} y\right)[2018] ? \mathbf{1 6}[\mathbf{2 , 0 , 0}]$
