

Wahrscheinlichkeitstheorie und Statistik

Serie 10

Version 1 (20. Mai 2022)

Bitte stellt Fragen in den Übungen und/oder im [Forum](#) des [Moodle-Kurs](#) (und/oder (anonym) in diesem file https://docs.google.com/document/d/1CfTkwrN0hTKB8y8cVQW_deUahCeJTbQWlm_BzrHIFYA/edit?usp=sharing)

Wir empfehlen die Aufgaben selbständig zu lösen und dann im Fach der entsprechenden Übungsgruppe im Raum HG G 53 abzugeben oder selbst mit der [Lösung](#) zu vergleichen am besten rechtzeitig vor der Übung am **30. Mai**.

Aufgabe 10.1 It costs 1 dollar to play a certain slot machine in Las Vegas. The machine is set by the house to pay 2 dollars with probability 0.45 and nothing with probability 0.55.

Let X_i be the house's net winnings on the i^{th} play of the machine.

Let $S_n := \sum_{i=1}^n X_i$ be the house's winnings after n plays of the machine. Assuming that successive plays are independent, find:

- (a) $\mathbb{E}[S_n]$;
- (b) $\sigma_{S_n}^2$;
- (c) the approximate probability that after 10,000 rounds of the machine, the house's winnings are between 800 and 1,100 dollars.

Aufgabe 10.2 Suppose that X_1, \dots, X_n form a random sample from a Poisson distribution for which the mean λ is unknown. Determine the maximum likelihood estimator for λ .

Aufgabe 10.3 In einer Nagelfabrik will man die Länge der produzierten Nägel möglichst genau schätzen. Man nimmt an, dass die Längen der Nägel $X_i, i = 1, \dots, n$, unabhängig und approximativ normalverteilt sind mit Varianz 1 mm^2 und unbekanntem Erwartungswert m mm. Wieviele Nägel muss man mindestens messen, damit das zweiseitige 95%-Konfidenzintervall für m höchstens Länge 0.5 mm hat?

Wenn du Feedback zum Übungszettel hast, schreibe bitte eine Mail an [Jakob Heiss](#).
