## Solutions 8

## 1. Locally symmetric spaces

Let $M$ be a connected $m$-dimensional Riemannian manifold. Then $M$ is called locally symmetric if for all $p \in M$ there is a normal neighborhood $B(p, r)$ such that the local geodesic reflection $\sigma_{p}:=\exp _{p} \circ(-\mathrm{id}) \circ \exp _{p}^{-1}: B(p, r) \rightarrow$ $B(p, r)$ is an isometry.
(a) Show that if $M$ is locally symmetric, then $D R \equiv 0$.
[Use that $d\left(\sigma_{p}\right)_{p}=-\mathrm{id}$ on $T M_{p}$.]
(b) Suppose that $D R \equiv 0$. Show that if $c:[-1,1] \rightarrow M$ is a geodesic and $\left\{E_{i}\right\}_{i=1}^{m}$ is a parallel orthonormal frame along $c$, then $R\left(E_{i}, c^{\prime}\right) c^{\prime}=$ $\sum_{k=1}^{m} r_{i}^{k} E_{k}$ for constants $r_{i}^{k}$.
(c) Show that if $D R \equiv 0$, then $M$ is locally symmetric.
$\left[\right.$ Let $q \in B(p, r), q \neq p$, and $v \in T M_{q}$. To show that $\left|d\left(\sigma_{p}\right)_{q}(v)\right|=|v|$, consider the geodesic $c:[-1,1] \rightarrow B(p, r)$ with $c(0)=p, c(1)=q$, and a Jacobi field $Y$ along $c$ with $Y(0)=0$ and $Y(1)=v$. Use (b).]

Solution. (a) Suppose that $M$ is locally symmetric, let $p \in M$ and $w, x, y, z \in$ $T M_{p}$. Then, since $\sigma_{p}$ is an isometry and $d\left(\sigma_{p}\right)_{p}=-\mathrm{id}$ on $T M_{p}$ we have

$$
\begin{aligned}
-\left(D_{w} R\right)(x, y) z & =d\left(\sigma_{p}\right)_{p}\left(D_{w} R\right)(x, y) z \\
& =\left(D_{d\left(\sigma_{p}\right)_{p} w}\right)\left(d\left(\sigma_{p}\right)_{p} x, d\left(\sigma_{p}\right)_{p} y\right) d\left(\sigma_{p}\right)_{p} z \\
& =\left(D_{-w} R\right)(-x,-y)-z \\
& =\left(D_{w} R\right)(x, y) z
\end{aligned}
$$

so $\left(D_{w} R\right)(x, y) z=0$.
b) Recall that for $X, Y, Z, W \in \Gamma(T M)$

$$
\begin{aligned}
D_{W}(R(X, Y) Z)= & R(X, Y) D_{W}(Z)+R\left(D_{W} X, Y\right) \\
& +R\left(X, D_{W} Y\right) Z+\left(D_{W} R\right)(X, Y) Z .
\end{aligned}
$$

Now, write $R\left(E_{i}, c^{\prime}\right) c^{\prime}=\sum_{k=1}^{m} f_{i}^{k} E_{k}$ for some functions $f_{i}^{k}:[-1,1] \rightarrow \mathbb{R}$.

Since $E_{i}$ and $c^{\prime}$ are parallel vector fields, the above relation implies that

$$
\begin{aligned}
0 & =\left(D_{\partial / \partial t} R\right)\left(E_{i}, c^{\prime}\right) c^{\prime} \\
& =D_{\partial / \partial t}\left(R\left(E_{i}, c^{\prime}\right) c^{\prime}\right) \\
& =\sum_{k=1}^{m} D_{\partial / \partial t}\left(f_{i}^{k} E_{k}\right) \\
& =\sum_{k=1}^{m}\left(\dot{f}_{i}^{k} E_{k}+f_{i}^{k} D_{\partial / \partial t} E_{k}\right) \\
& =\sum_{k=1}^{m} \dot{f}_{i}^{k} E_{k}
\end{aligned}
$$

hence the $f_{i}^{k}$ are constant.
c) Let $q \in B(p, r), q \neq p$ and $v \in T M_{q}$. We must show that $\left|d\left(\sigma_{p}\right)_{q}(v)\right|=$ $|v|$. Let $c:[-1,1] \rightarrow M$ be the geodesic with $c(0)=p$ and $c(1)=q$. Let $Y$ be the Jacobi field along $c$ with $Y(0)=0$ and $Y(1)=v$. Since $\sigma_{p}$ reverts geodesics it follows that $d\left(\sigma_{p}\right)_{q} Y(1)=Y(-1)$, so it remains to show that $|Y(1)|=|Y(-1)|$. Write $Y=\sum_{i=1}^{m} h^{i} E_{i}$ for some functions $h^{i}:[-1,1] \rightarrow \mathbb{R}$ then the Jacobi equation implies that

$$
\ddot{h}^{k}+\sum_{i=1}^{m} h^{i} r_{i}^{k}=0
$$

with $h^{i}(0)=0$, for $k=1, \ldots, m$. It follows that $h^{i}(-t)=-h^{i}(t)$ for all $t \in[-1,1]$. In particular $|Y(-1)|=|Y(1)|$.

## 2. Conjugate points in manifolds with curvature bounded from above

(a) Prove directly, without using the Rauch Comparison Theorem, that there are no conjugate points in manifolds with non-positive sectional curvature.
(b) Show that in manifolds with sectional curvature at most $\kappa$, where $\kappa>$ 0 , there are no conjugate points along geodesics of length $<\pi / \sqrt{\kappa}$.
(c) Show that if $c:[0, \pi / \sqrt{\kappa}] \rightarrow M$ is a unit speed geodesic in a manifold with sec $\geq \kappa>0$, then some $c(t)$ is conjugate to $c(0)$ along $\left.c\right|_{[0, t]}$.

Solution. (a) Let $Y$ be a Jacobi field along some geodesic $c:[0, l] \rightarrow M$ with $Y(0)=0$ and define $f:[0, l] \rightarrow \mathbb{R}, f(t):=|Y(t)|^{2} \geq 0$. By our assumption, we have $R\left(Y, c^{\prime}, Y, c^{\prime}\right) \leq 0$ and therefore

$$
\begin{aligned}
f^{\prime}(t) & =2\left\langle Y(t), Y^{\prime}(t)\right\rangle \\
f^{\prime \prime}(t) & =2\left\langle Y^{\prime}(t), Y^{\prime}(t)\right\rangle+2\left\langle Y(t), Y^{\prime \prime}(t)\right\rangle \\
& =2\left|Y^{\prime}(t)\right|^{2}-2 R\left(Y(t), c^{\prime}(t), Y(t), c^{\prime}(t)\right) \geq 2\left|Y^{\prime}(t)\right|^{2} \geq 0
\end{aligned}
$$

This implies that $f$ is convex and hence, if $Y(t)=0$ for some $t>0$, we get $\left.f\right|_{[0, t]} \equiv 0$, i.e. $Y \equiv 0$.
(b) First, consider the model space $M_{\kappa}$ with constant sectional curvature $\kappa$. Let $\bar{c}:[0, l] \rightarrow M_{\kappa}$ be a geodesic with $\left|\bar{c}^{\prime}(t)\right|=1$ and $\bar{Y}$ a Jacobi field along $\bar{c}$ with $\bar{Y}(0)=0$. Such a Jacobi field is given by

$$
\bar{Y}(t)=a t \bar{c}^{\prime}(t)+b \sin (\sqrt{\kappa} t) N(t)
$$

where $N$ is a normal and parallel vector field along $\bar{c}$, compare 1 in Serie 7. In particular, we have $|\bar{Y}(t)|>0$ for $0<t<\pi / \sqrt{\kappa},(a, b) \neq(0,0)$ and therefore, $\bar{c}(t)$ is not conjugate to $\bar{c}(0)$ along $\bar{c}$.

For a manifold $M$ with sec $\leq \kappa$, we can now apply the Rauch Comparison Theorem for $M$ and $M_{\kappa}$. We conclude that if $Y$ is a Jacobi field with $Y(0)=0$ and $Y^{\prime}(0) \neq 0$ along some geodesic $c:[0, l] \rightarrow M$ with $L(c)<\pi / \sqrt{\kappa}$, we have $|Y(t)| \geq|\bar{Y}(t)|>0$.
(c) Assume that there are no conjugate points along $c$.

Let $\bar{c}:[0, \pi / \sqrt{\kappa}] \rightarrow M_{\kappa}$ be a geodesic and consider the Jacobi field $\bar{Y}(t)=\sin (\sqrt{\kappa} t) N(t)$ for some normal and parallel vector field $N$ along $\bar{c}$. Furthermore, let $Y$ be a normal Jacobi field along $c$ with $Y(0)=0$ and $\left|Y^{\prime}(0)\right|=\left|\bar{Y}^{\prime}(0)\right|$. But then we get by the Rauch Comparison Theorem that $\left|\bar{Y}\left(\frac{\pi}{\sqrt{\kappa}}\right)\right| \geq\left|Y\left(\frac{\pi}{\sqrt{\kappa}}\right)\right|>0$, a contradiction.

## 3. Volume comparison

Let $M$ be an $m$-dimensional Riemannian manifold with sectional curvature $\sec \leq \kappa, p \in M$ and $r>0$ such that $\left.\exp _{p}\right|_{B_{r}(0)}$ is a diffeomorphism. Furthermore, let $V_{\kappa}^{m}(r)$ denote the volume of a ball with radius $r$ in the $m$ dimensional model space $M_{\kappa}^{m}$ of constant sectional curvature $\kappa \in \mathbb{R}$. Prove that $V\left(B_{r}(p)\right) \geq V_{\kappa}^{m}$.

Solution. Note first that if $\kappa>0$, then $V_{\kappa}^{m}(r)=V_{\kappa}^{m}\left(D_{\kappa}\right)$ for all $r>D_{\kappa}:=$ $\pi / \sqrt{\kappa}$ (the diameter of $M_{\kappa}^{m}$ ). Hence, if $\kappa>0$, we may assume that $r \leq D_{\kappa}$.

Choose a base point $\bar{p}$ in $M_{\kappa}^{m}$ and a linear isometry $H: T M_{p} \rightarrow T\left(M_{\kappa}^{m}\right)_{\bar{p}}$. Since $\left.\exp _{p}\right|_{B_{r}}$ is a diffeomorpism onto its image, we know from Proposition 1.21 that $B_{r}(p)=\exp _{p}\left(B_{r}\right)$. Define $F: B_{r}(p) \rightarrow B_{r}(\bar{p})$ by $F:=\exp _{\bar{p}} \circ H \circ$ $\left(\left.\exp _{p}\right|_{B_{r}}\right)^{-1}$. The proof of Corollary 3.19 shows that for all $x, w \in T M_{p}$ with $|x|<r$,

$$
\left|d\left(\exp _{p}\right)_{x}(w)\right| \geq\left|d\left(\exp _{\bar{p}}\right)_{H x}(H w)\right|
$$

Thus, for all $q \in B_{r}(p)$ and $v \in T M_{q}$,

$$
\left|d F_{q}(v)\right| \leq|v| .
$$

This implies that the volume distortion factor $J_{F}(q)$ of $F$ at $q$ is $\leq 1$. Hence,

$$
V_{\kappa}^{m}(r)=V\left(B_{\bar{p}}(r)\right)=\int_{B_{p}(r)} J_{F}(q) d V(q) \leq V\left(B_{p}(r)\right)
$$
