SINGULAR HOMOLOGY

Definition

A SINGULAR N-simplex in X is a map $G: \Delta^{V} \to X$. The word singular is used to express the idea that G need not be a nice embedding, but can have 'singularities' where its image does not look like a

rémplex. All that is repuired es that 3 is continuous.

Definitions $S_n(x)$ is the free abelian group generated by all the singular h-simplifies $G: \Delta^n \longrightarrow X$ of x. We call $S_n(x)$ the GROUP OF SINGULAR h-CHAINS of x. A singular r-chain is a (finite) formal sum

$$\sum_{G:\Delta^{N}\to X} n_{G} \cdot G, n_{G} \in \mathbb{Z}.$$

the BOUNDARY MAP is diffed by the same formula as before: $\partial_n(\mathcal{E}) = \sum_{i} (-1)^i \mathcal{E}_{V_0, \dots, \tilde{V}_{i}, \dots, V_{n}}$

Bl Evo, ..., Vn J in regarded as a map sn-1 -> x via the commical identification of Evo, ..., Vi ,..., Vn with sn-1 preserving the ordering of the vertices

the proof that drodn+1=0 works the same as in the simplicial Notation: We often denote all ∂_n by ∂ and write $S_n(x) \xrightarrow{3} S_{n-1}(x) & \partial_0 = 0$. homology case, Definition $(S_{a}(x), \partial_{a})$ is a chain complex. The SINGULAR MOMOLOGY graps cycles $Kend_n = Z_n(x)$ are Hn (x)= Ker On Im Dn= Bn(x) Im Dn+1 boundaries X point, What are the homology groups of X2 tor each dimension n20 we have exactly one singular simplex

$$G_{n}: \Delta^{n} \rightarrow X, So, S_{n}(X) = Z \cdot G_{n}.$$
We now calculate $\vartheta_{n}: S_{n}(X) \rightarrow S_{n}(X)$

$$\Im_{n}(G_{n}) = an alternating sum of (n+2) elements each
of which $F = G_{n-1}$

$$\Im_{n}(G_{n}) = \begin{cases} 0 & n = \sigma dd \\ G_{n-1} & n \text{ is even } > 0 \\ 0 & n = 0 \end{cases}$$

$$\longrightarrow S_{3}(X) \xrightarrow{23} S_{2}(X) \xrightarrow{23} S_{1}(X) \xrightarrow{23} S(X) \rightarrow 0$$

$$\lim_{n \to \infty} Z \xrightarrow{2} Z \xrightarrow{2} Z \xrightarrow{2} Z \xrightarrow{2} Z$$

$$\Im_{n} \text{ is an isomorphism for wen n>0}$$
and the zero map when m is$$

Gdd.

Cycles: ZZ = N = odd $Z_n(x) = \begin{cases} Z = 0 \\ Z = 0 \end{cases}$ N = 0

Boundaries

$$B^{U}(x) = \begin{cases} 0\\ 0\\ X \end{cases}$$

$$H_{n}(x) = \begin{cases} 0 \\ 0 \\ ZZ \\ \zeta Z \\ \zeta Z \\ 0 \end{cases}$$

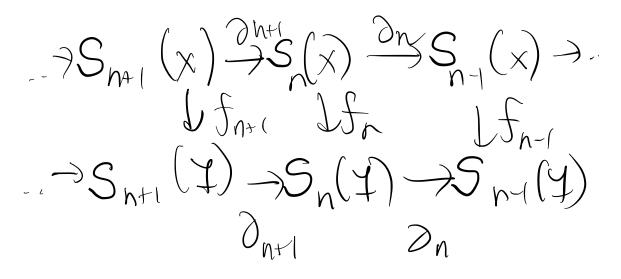

$$n = odd$$

 $n = even \ 8 > 0$
 $n = 0$
 $n = 0$
 $n = 0$
 $n \neq 0$

FUNCTORIAL PROPERTIES Let fix->1 be a map between the spaces X&I. For every

Singular n-simplex G: An->X, we get a new singular simplex induced by $f \circ G : \Delta^n \rightarrow \underline{1}$. Extending linearly we get a homomorphism defined by $f_n = S_n(f) : S_n(X) \to S_n(Y)$ $f_m \left(\sum_{g \in \mathcal{G}} \mathcal{G}_g \right) \geq n_g \left(f_{0G} \right)$. Proposition $f_{n-1} \circ \tilde{J} = \tilde{J} \circ f_n \quad (f_c \circ \tilde{J} = \tilde{J} \circ f_c).$ Proof $f_{n-1} \circ f(\mathcal{C}) \circ f_{n-1} \left(\sum_{i=1}^{n-1} (-1)^{i} \delta \right|_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} \mathcal{V}_{i} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} = \sum_{i=1}^{n-1} (-1)^{i} f \circ \delta |_{[\mathcal{V}_{0}, -)} = \sum_{i$ $= \Im_{n}(f_{0}, g) = \Im_{n} \circ f_{n}(g) \boxtimes$

thus we have a commutative diagram

Homomorphisms $f_c: S_o(X) \rightarrow S_o(X)$ that Satisfy $f_c \circ \partial = \partial \circ f_c$ are called CHAIN MAPS from the singular chain complex of X to hat of I.
